

Voicepoint Argon®

Additional benefits for Dragon Medical One, Voicepoint Helium® and Winscribe

Our modules in the areas of vocabulary, user administration, device management and support optimisation offer you increased added value. Whether you are adjusting the language profiles of users or automating your internal documentation and administrative processes, Voicepoint Argon® provides you with the appropriate additional modules. We recommend using all modules for the best experience when working with Dragon Medical One, Voicepoint Helium® or Winscribe.

Voicepoint Argon® Lex

[Increase the accuracy of your speech recognition](#)

Dragon Medical One and Voicepoint Helium® provide a basic medical vocabulary with expressions for various medical specialties out of the box. However, the terminology or specific formulations and abbreviations used are very individual for each doctor's practice, clinic or hospital. New expressions, designations or medications are frequently added, which should be incorporated into the vocabulary for optimal performance. In addition to the analysis and review of medical documentation that complies with data protection requirements, we use our Voicepoint Argon® Lex tools to provide vocabularies for a wide range of medical specialisations. We offer these vocabularies in addition to Dragon Medical One and Voicepoint Helium®. With Voicepoint Argon® Lex, we ensure that the speech recognition solution delivers a very high level of recognition accuracy very quickly and can maintain this performance over the long term.

Top quality thanks to medical professionals

Voicepoint Argon® Lex vocabularies have been created with the help of Voicepoint's medical experts. Not only are technical terms recognised correctly the first time they are used, but the correct spelling is also ensured thanks to our professional expertise. The vocabularies are created exclusively in Switzerland and are designed for the Swiss healthcare system. They include common medications, cities as well as Swiss specific medical expressions.

Customised vocabulary – your personal Voicepoint Argon® Lex vocabulary

In addition to the Voicepoint Argon® Lex vocabularies, we offer the option of customising the vocabulary to suit your application. By processing your personal documents such as reports, diagnoses, letters or expert opinions, the vocabulary is adapted to your specific texts. The language used varies from person to person; individual formulations, abbreviations and technical terms are used depending on the user. Even if this only accounts for a small percentage of the entire vocabulary, the time and effort required to maintain these should not be underestimated. With Voicepoint Argon® Lex, we add missing words to your vocabulary and thereby ensure that the recognition accuracy of your speech recognition solution is very high from the outset. This contributes significantly to a considerable increase in productivity and user convenience. Your documents are treated in accordance with current data protection requirements. If you wish, we will be happy to draw up a confidentiality agreement to respond to your data security conditions.

Voicepoint Argon® Link

[Increased efficiency through integration in third-party applications](#)

Discover our wide range of integration tools that allow you to integrate our solutions directly into your applications: Voicepoint Argon® Link offers a portfolio of APIs and tools that allow us to connect our applications to our customers' practice/clinical information systems, EMRs – as well as to a RIS or PACS.

Voicepoint Argon® Device

Device Management Software for Dragon Medical One and Winscribe Dictation

Voicepoint Argon® Device offers a centralised management console for stationary and mobile dictation devices, providing the perfect addition to your speech recognition and dictation solution. A web interface allows administrators to manage dictation devices, assign them to different groups or update their firmware version. For mobile dictation devices, Voicepoint Argon® Device also offers an intuitive and clear configuration component that can be used to configure individual device settings on a group basis or per dictation device. Workflow information can be flexibly defined for each dictation device to optimise the integration with Voicepoint Argon® Device into a dictation solution. Dictation devices receive the latest firmware version and device configuration directly from the Voicepoint Argon® Device client when they are started up, connected or when the manual update function is used, without the need for time-consuming installation of parallel device manufacturer software from the server.

Increased efficiency in dictation recording by importing dictations from mobile dictation devices

Voicepoint Argon® Device can be used to import dictation from mobile dictation devices. The settings for dictation import are configured via the web interface and dynamically adopted by the Voicepoint Argon® Device client each time the device is connected. Any dictations are checked when the device is connected, uploaded via the Voicepoint Argon® Device web interface and stored on the server at the configured storage location for further processing.

Voicepoint Argon® Identity

Web-based user administration tool

Voicepoint Argon® Identity offers a centralised and automated user management system that perfectly complements the Nuance Management Center (DMO and DPA/DLA) and the Winscribe Dictation software. A web interface allows Voicepoint Argon® Identity administrators to synchronise users of Active Directory groups with the NMC and Winscribe Dictation configuration. This means that users can be automatically assigned or removed from the correct group, site and organisation in the NMC and the correct department and text editor group in Winscribe Dictation.

Monitor your environment in a variety of ways

For Dragon Medical, automated licence management of the available Dragon licences in the NMC is also supported. This means that configured licences are automatically assigned or released when a user joins, mutates or leaves the company, enabling optimal use of the licences. A dashboard, extensive logs and a detailed overview of the processes are available to administrators for analysing and monitoring the synchronisation. Voicepoint Argon® Identity is suitable for both new and existing installations: thanks to the integrated assignment function, existing users can be efficiently linked to the corresponding Active Directory users.

Any questions?

We would be happy to advise you on our products, services and possible test installations by email at info@voicepoint.ch or by phone at [+41 44 933 39 39](tel:+41449333939).
