

Winscribe from the Voicepoint Cloud

Cloud-based software solution for managing digital dictations with optional speech recognition

Winscribe is a cloud-based software solution for managing digital dictations that has been developed for hospitals, clinics, medical practices and independent doctors. The software consists of various modules that can be customised to individual requirements and needs, making your daily work much easier. The Winscribe software solution, which we have been deploying in hospitals and clinics throughout Switzerland since 2006, is also available in the cloud. The seamless integration of the Dragon speech recognition solution from Microsoft makes it possible to provide the secretariat with the audio file and the speech-recognised text, thus saving time.

Voicepoint Cloud – your Swiss cloud solution for dictations and speech recognition

The Voicepoint Cloud provides a secure cloud-based solution for the deployment of our dictation management solution and speech recognition solutions. It is based on the Microsoft Azure infrastructure in Switzerland and the servers are located in Zurich. Our security practices, combined with our highly available infrastructure, enable users to conveniently use our powerful and secure services regardless of their location.

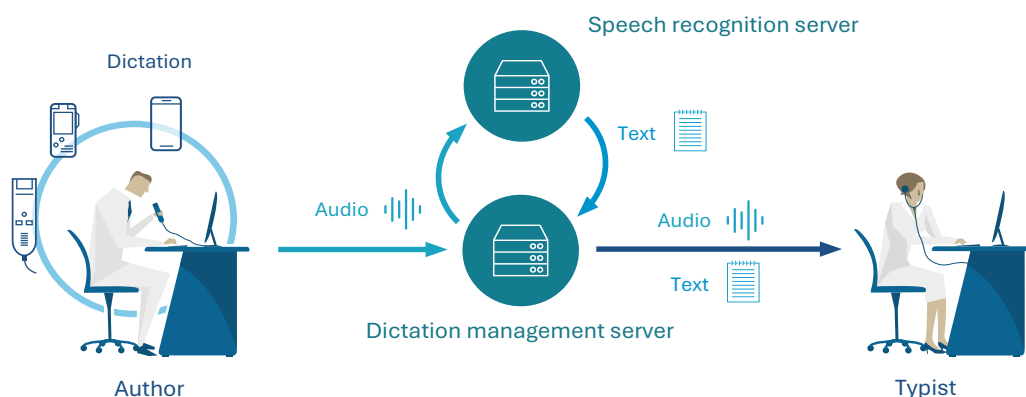

Medical speech recognition from Nuance

Winscribe supports the Dragon Medical One (DMO) speech recognition system, which is based on the latest neural engine developments and offers unrivalled recognition accuracy. When combined with Dragon Medical speech recognition in the Voicepoint Cloud, Winscribe offers a high level of user-friendliness, regardless of where you want to record your dictations. While you dictate your report as usual, the speech recognition software makes the text available to the secretary immediately. Productivity increases, transcription

work is optimised and there is more time for patients. For doctors, hospitals and clinics, there is no need for expensive internal or external IT infrastructure: the client applications are available via a straightforward installation from the Voicepoint Cloud.

Foreground speech recognition with Dragon Medical One

Using the leading speech recognition software, you can create your texts more efficiently and accurately in the desired application. Whether you are documenting directly into a practice information system, generating a report in Microsoft Word or composing an email, the text will appear exactly where you want it. The Dragon Medical One solution can be used alongside Winscribe, so you can create reports immediately or send the dictation directly to your medical assistants.

Background speech recognition with Winscribe

Winscribe integrates background speech recognition with Dragon Medical One. This means that Winscribe users benefit from powerful background speech recognition. Dictations can be created using professional mobile or desktop dictation devices, as well as the Winscribe smartphone application, and converted to text on the server using speech recognition. This makes the documentation process significantly more efficient for the medical assistants, as it contains both the audio and the text created by the speech recognition system.

Winscribe Author

Easily create and manage your digital dictations with the Winscribe Author application. You have the option of dictating with a desktop dictation microphone directly in Winscribe Author from your workstation. Alternatively, you can work with a mobile digital dictation device or a smartphone. Winscribe Author can be used flexibly in your practice or at home. This allows you to check your dictations, follow the current dictation flow or simply complete a waiting dictation. All your dictations are stored centrally, so that you and your team have access.

Winscribe for smartphones

Winscribe offers a user-friendly dictation app for iOS and Android smartphones. It simplifies and speeds up the dictation process by allowing you to dictate easily while you are out and about, between appointments or at home. The app allows you to see the status of your dictations, including those that have been completed, because the app is synchronised with the cloud, giving you real-time information.

Voicepoint Argon®

Voicepoint Argon® Device

Voicepoint Argon® Device provides you with a comprehensive solution for managing your professional dictation devices. Dictations, firmware and device configuration can be easily transferred with it, regardless of location.

Voicepoint Argon® Identity

Voicepoint Argon® Identity offers a centralised and automated user management system that perfectly complements the Nuance Management Center (DMO and DPA/DLA) and the Winscribe Dictation software. Users can be managed automatically via an Active Directory connection, allowing for flexible and efficient user management and licensing.

Voicepoint Argon® Link

Discover our wide range of integration tools that allow you to integrate our solutions directly into your applications: Voicepoint Argon® Link offers a portfolio of APIs and tools that allow us to connect our applications to our customers' hospital information systems, as well as to a RIS or PACS.

Voicepoint Configuration Manager

This software, which is available as an add-on to Winscribe, allows the centralised configuration of the Winscribe client components via a web application. User-specific settings are stored in the Winscribe database and applied independently of the workstation. The configurations include, for example, the option settings in the software or the button assignment of the foot pedals and stationary dictation devices. The configuration templates can be selectively assigned to individual users or departments, as well as to the entire organisation.
